# CAPSILUR

## Plant extracts with biofungicidal properties

The main goal of the **CAPSILUR** project is to **develop a non-toxic, natural and efficient biofungicide** from agrifood waste to fight crop diseases caused by soil fungi.

By combining the principles of agroecology and the advanced techniques of biotechnology, **active ingredients with fungicidal and bactericidal properties** will be extracted from plant remains to **formulate a product with proven effectiveness and safety.**

This development will also ensure the **recovery of different types of agrifood waste**, thus contributing towards the financial viability of different farms by improving their productivity and promoting their financial sustainability.

The value of this project is to offer a **safe, viable alternative to synthetic fitosanitary products**, thus minimising the environmental impact they often have on ecosystems and safeguarding biological and water resources.
